for DNA molecule 1 1s in mammals, יייי טוגמוויטלביי טוגמוויטלביים אוף-Dinding cassette and corresponding DN preventing, diagnosing and treating Chlamydia infections particular humans

Claim 2; Fig 1; 88pp; English.

The present invention relates to novel Chlamydia pneumoniae ATP-binding cassette protein and its corresponding gene. Sequences of the invention are useful for detecting chlamydia infection by assaying a body fluid of a mammal with the components. They are also used as vaccines. Ampliating of a mammal with the components. They are also used as vaccines. Ampliating cassette antibodies and vaccines of the invention are useful for preventing or treating Chlamydia Infection eq. infection caused by c. trachomatis, c. psittaci, c. pneumoniae or c. pecorum in mammals, as humans. The nucleic acid molecules are useful for producing as poxyluses, which are further useful for preventing and/or treating as poxyluses, which are further useful for preventing and/or treating strains that can over-express the nucleic acid molecules or express it in a non-toxic, mutated form. The present sequence is a gene encoding chlamydia pneumoniae ATP-binding cassette.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents the complete genome of Chlamydia pneumoniae, and encodes proteins AAY3584-Y35879. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypetides encoded by the open reading frames of the C. pneumoniae genome (see NAX3584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Db 244380 acttccccctgctaaactatgctcagataatgctgctatgattgcaggtctaggggggg 244439

polypeptides AAY36754-Y37949. The polypeptides can be used as vaccines against chlamyda trachomatis. Antisense and ribosyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion

The present invention relates to the isolation of Chlamydophila pneumoniae strain CML029 genes and their encoded proteins. The genes of the invention encode an APP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, a protease, a reprofesse, clp protease submit, a ransqlyoclase/transpeptidase, a CLP protease submit, a genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Chlamydia infections. Also described are B- and T-cell epitopes from the proteins of the invention which can be used as Chlamydia antigens. AASI8750-AASI8759 represent the C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Secretary locus ORF; protease; metalloprotease; CLP protease ATPase;

The present invention relates to the isolation of Chlamydophila pneumoniae strain CWL029 genes and their encoded proteins. The genes of the invention encode am ATP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, an endopeptidase, a repression it, a metalloprotease, CLP protease ATPRASE, a CLP protease subunit, a perangproclase, transpeptidase, a CLP protesse, or thioredoxin. The genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Chlamydia infections. Also described are B- and T-cell epitopes from the proteins of the invention which can be used as Chlamydia antigens. AAS18750-AAS18759 represent the C. pneumoniae
                                                                                                                                                                                                                                                                                                                         endopeptidase;

Hanson MS, GENOME SCI INC Erwin AL, MEDIMMUNE (HUMA-) HUMAN Choi GH, (MEDI-)

New isolated Borrelia burgdorferi nucleic acids - used to develop products for the diagnosis, prevention and treatment of diseases caused by Borrelia, particularly Lyme disease Lathigra R; WPI; 1999-189980/16. P-PSDB; AAY20067

Claim 1; Page 182-183; 275pp; English.

This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for the Borrelia genus. The products can also be used for the Borrelia genus.

New isolated Enterococcus faecalis polynucleotides - used to develop lucts for the detection of Enterococcus and for use in vaccines prevention or attenuation of Enterococcus infection products

Claim 1; Page 107-108; 301pp; English.

The present sequence encodes an antigenic polypeptide fragment isolated from Enterooccus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nuclectide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein activity

Sequence 1028 BP; 350 A; 174 C; 234 G; 269 T; 1 other;

The present invention describes genes, proteins and antigenic polypeptides isolated from E. faccalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be sequences can be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids.

Production of proteins, such as hormones, enzymes, growth factors or cytokines, in gram-positive microorganisms containing a mutation in at least one of the genes of the opp operon gene cluster

Disclosure; Fig 1A-M; 32pp; English.

The opp operon of Bacillus (also known as spook operon) encodes an oligopeptide permease that is required for the initiation of sporulation and the development of genetic competence. The opp operon is a member of the family of ATP-binding cassette (ABC) transporters involved in the import or export of oligopeptides from 3-5 amino acids. Bacillus strains containing a mutation in the opp operon produce more recombinant protein than the wild-type strain. Therefore, gram-positive microorganims, especially Bacillus strains, containing a mutation in at least one of the genes of the opp operon can be used for heterologous protein production, especially hormones, enzymes (preferably proteases such as subtilisin), growth factors or cytokines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2;
                                                                                                                                                                                                                                                                                             The present sequence encodes an antigenic polypeptide fragment isolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic accids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein activity.

                                                                                                                  Entercoccous facealis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. facealis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Entercoccus genus in a namimal. They can also be used for detecting Entercoccus antibodies in a sample. The nucleotide sequences can be used for detecting Entercoccus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enterococcus faecalis; infection; vaccine; immune response; diagnosis; detection; attenuation; antigenic; ss.

AXI2938 to AXX1319 represent these nucleotide sequences which are primary nucleotide sequences isolated from the Enterococcus facealis genome. AXX12938 to AXX13919 represent these nucleotide sequences which are primary nucleotide sequences. Also known as contigs. The computer-based system can identify fragments of the Enterococcus facealis genome with commercial importance. The products can be used to detect the presence of Enterococcus facealis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus facealis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus facealis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                       A computer readable medium has been developed which has recorded on it

Claim 1; Page 562-570; 2084pp; English.

A computer readable medium has been developed which has recorded on it and solution to the sequences isolated from the Enterococus facalis genome. AAX1938 to AAX19319 represent these nuclectide sequences which are primary nuclectide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococus facalis genome with commercial importance. The products can be used to detect the presence diagnosing Enterococus facalis in samples. They can also be used for diagnosing Enterococus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus facalis, or another related organism, in vivo or in vitro. In particular the products of the Enterococcus facalis in the Enterococcus facalis in the can be used in vaccines to prevent or attenuate an Enterococcal
